

Aging can't be stopped, it can be slowed

Introduction

Aging can't be stopped, it can be slowed. Most people get wrinkles and lose their health, energy, hair and vitality faster than they should because no one ever taught them how to protect their body. The truth is: you don't have to age 12 months for every year you live. By making the right choices, you can slow your speed of aging, feel younger and even extend your health and life span. This guide will teach you the basics. You'll learn the 8 core areas that determine how fast or slow you age and the exact steps you can take to slow the aging process today.

Nutrition

1. Keep sugar and refined carbs low: Sugar binds to proteins and creates compounds called Advanced Glycation End Products (AGEs). Think of AGEs as "internal rust" they stiffen your skin (wrinkles), harden your arteries (heart disease risk), and damage your joints (joint pains). By reducing sugar and refined carbs, you reduce glycation and slow down visible and invisible aging.
2. Cook low and slow: That crispy, golden-brown crust on fried or grilled food? Those are also AGEs. High-heat cooking makes your food tasty (I also love my steak with a nice crust) but sadly it forms compounds that accelerate aging. Switch to steaming, boiling, or slow cooking.
3. Eat repair foods daily: Longevity/Anti-aging isn't just about avoiding damage, it's also about repairing it. Omega-3s from for example wild salmon reduce inflammation (which drives nearly every age-related disease) and strengthen cell membranes in the brain, improving mood and memory. Polyphenols in berries fight oxidative stress by neutralizing free radicals that would otherwise damage DNA, proteins, and mitochondria. Extra virgin olive oil provides antioxidants that prevent LDL cholesterol from oxidizing which are a key trigger for clogged arteries. Keeping your blood vessels elastic and "young" so more oxygen and nutrients reach every part of your body. Each of these foods doesn't just "feed you," they literally protect your cells.

Movement

1. Zone 2 cardio: Zone 2 cardio is low-intensity movement that burns fat efficiently and improves mitochondrial health. It's the foundation of endurance and energy. Think 45–60 minutes of jogging, cycling or rowing at around 79–81% of your maximum heart rate.
2. Sprint/VO₂max training: Short, intense bursts like sprints (Zone 5 training) improve your VO₂max which is the measure of how well your body uses oxygen. VO₂max is one of the strongest predictors of longevity.
3. Strength training and plyometrics: Muscle isn't just for looks. Strength training preserves bone density, boosts hormones like testosterone, and keeps your metabolism high. Add plyometrics or speedwork to stay agile and explosive. It's the difference between just surviving and thriving as you age.

Sleep & Light

1. Morning sunlight: Sunlight literally makes hormones. When UVB light hits your skin, it produces vitamin D which controls over 1,000 genes linked to immunity, bone health and even testosterone. At the same time, bright morning sunlight tells your brain it's daytime, syncing your circadian rhythm so melatonin (your sleep hormone) gets released properly at night. 2. Cut artificial light at night: Blue light from screens at night tricks your brain into thinking it's still daytime. This suppresses melatonin (your sleep hormone) and without or with less of that your body thinks it's still daytime and blocks deep, restorative phases of sleep. 3. Consistency Wins: Going to bed and waking at the same times trains your body into deeper and more restorative sleep which are your body's most powerful repair modes. During deep sleep, your brain clears out toxins like beta-amyloid (linked to Alzheimer's), your muscles rebuild, and growth hormone peaks. Missing out on deep sleep accelerates every aging pathway from glycation to hormone disruption.

Hormones

1. Sleep, Training, and Smart Protein Balance: Hormones control energy, mood, muscle growth, and recovery. Testosterone and growth hormone rise with quality sleep, strength training, and protein intake. Nutrition plays a big role too — you need enough protein to support muscle repair, collagen, and enzymes, but not so much that it constantly switches your body into “growth mode.” Too much protein (especially constant high doses of leucine) can blunt sirtuin activation which are one of the key repair pathways linked to longevity. The sweet spot is getting high-quality protein in the right amounts and at the right times while leaving room for fasting windows or lower-protein meals that activate repair. 2. Ditch plastics and Chemicals: Endocrine disruptors are chemicals found in plastics, oxidized oils & fats and cosmetics that mimic and/or block your natural hormones. Avoid plastic bottles, processed oils and toxic/non-natural personal care products. Protecting your endocrine system keeps testosterone, thyroid, and estrogen balanced. 3. Manage stress to control cortisol: Cortisol is useful short bursts but chronic stress keeps it elevated which breaks down muscle, raises blood sugar, increases belly fat and accelerates aging. Tools like breathwork, cold therapy or meditation can help balancing cortisol.

Environment & Mindset

1. Filter your water and air: Toxins, heavy metals and pollutants accelerate aging. Filter your water and air where possible. It's one of the simplest high-return investments in health. 2. Avoid mold, smoke and chemicals: Mold toxins, smoke and chemical-heavy cosmetics damage mitochondria and disrupt hormones. Remove what you can from your daily environment. 3. Purpose Extends Lifespan: People with a strong sense of purpose live longer and healthier. Having a reason to wake up in the morning activates survival and repair pathways in your body. 4. Being Outside daily: Grounding, fresh air and sunlight are free anti-aging therapies. Nature restores your nervous system, lowers stress by recharging your mitochondria.

Cellular Repair

1. Fasting windows for autophagy: During long enough fasting windows, your body clears out damaged cells and proteins, making room for new ones — this process is called autophagy. 2. Polyphenols to Activate Longevity Pathways: Compounds like resveratrol, green tea and cacao

activate sirtuins that regulate repair and longevity. 3. High-quality Protein: Your body needs amino acids for collagen, enzymes, and tissue repair. High-quality proteins (eggs, fish, grass-fed meats) allow your body to actually rebuild and repair.

Skin, Hair & Nails

1. Avoiding oxidized oils: Industrial refined seed oils and fried foods oxidize in your body and damage collagen which result in weaker skin, hair and nails. 2. Loading Up on Nutrients: Zinc, silica, vitamin C and collagen are essential for skin elasticity, strong nails and hair growth. Best sources are oysters, bone broth, citrus fruits and greens. 3. Protect and Repair with Light: Too much UV and blue light = faster aging. Red light therapy stimulates collagen and skin repair.

Now It's Time to Act

You now understand the foundations of longevity. But knowledge alone won't change your situation, action will. That's why I created the Kratos Protocol. Aging can't be stopped, but it CAN be slowed. With the Kratos Protocol, you work directly with me for 12 weeks. I build your personalized blueprint, then adjust it every week based on your progress in our calls. Between calls, we stay connected through direct messaging for all your questions. On top of that, you get lifetime access to all my e-Books, guides, protocols and checklists. Together, we will slow your speed of aging. Within weeks you'll notice improvements in energy, recovery, sleep, focus, performance and even visible changes in skin, hair, nails and body composition. I will get you the results you're looking for. I'm so confident that if you don't notice improvements after 12 weeks, I'll keep working with you for free until you do. If you're not ready for 1:1 coaching, I've built easy to follow Protocols for every area of longevity, simple science backed blueprints that show you exactly what to do, why it works and how to apply it to your life today.
